Write the eccentricity-based definition of a conic given in section 10.9. SCORE: /7 PTS GIVEN A POINT F AND A LINED, A CONIC IS THE LOCUS OF POINTS P SUCH THAT PE IS A FIXED CONSTANT (WHERE PQ IS THE PERPENDICULAR DISTANCE FROM P TO D)

Consider the graph of the polar equation 
$$r = -6 + 3\cos\theta$$
.

[a] How far from the pole is the farthest point on the graph?
$$-9 \le \checkmark \le -2$$

[b] Find all values of  $\theta$  (for  $0 \le \theta < 2\pi$ ) where the graph passes through the pole.

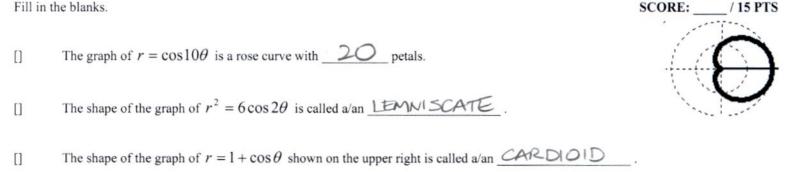

$$y=3---\frac{(x,3)}{(x,y)}$$

$$\sqrt{(x-4)^2 + (y+2)^2} = 3 - y$$

$$(x-4)^2 + (y+2)^2 = (3-y)^2$$

$$(x-4)^2 + y^2 + 4y + 4 = 9 - 6y + y^2$$

$$(x-4)^2 = -10(y-\frac{1}{2})$$

For a parabola, the AXIS OF SYMMETRY passes through the vertex and the FOCUS and is perpendicular to the DIRECTRIX.

Consider the graph of the polar equation  $r^3 = \sin 2\theta$ .

SCORE: / 15 PTS

[a]

[b]

Determine whether the graph is symmetric with respect to the pole, the polar axis, and 
$$\theta = \frac{\pi}{2}$$
.

$$(r, \pi+\Theta)$$

$$r^{3}=\sin \Im(\pi+\Theta)$$

$$(r)^3 = \sin 2(-0)$$
  
 $-r^3 = -\sin 20$ 

(-r, -0)

O=I

$$r^{3} = \sin (2\pi + 2\theta)$$

 $r^3 = \sin 2\theta$ 

SYM OVER POLE

What is the minimum interval for  $\theta$  that you would need to plot points before using symmetry to finish drawing the graph?

$$r^3 = -\sin 2\theta$$

$$r^3 = \sin 2\theta$$

$$\ni$$

SO, ALSO SYM OVER POLAR AXIS

$$r^3 = sm(2\pi + 2\theta)$$
  
 $r^3 = sm 2\pi cos 2\theta + cos 2\pi sm 2\theta$ 

[a] Is the conic a circle, a parabola, an ellipse or a hyperbola?

[b] Find the standard form of the equation of the conic.

$$4(x^{2}+2x)-9(y^{2}-4y)=-108$$

$$4(x^{2}+2x+1)-9(y^{2}-4y+4)=-108+4\cdot1-9\cdot4$$

$$4(x+1)^{2}-9(y-2)^{2}=-140$$

$$\frac{(y-2)^{2}}{9}-\frac{(x+1)^{2}}{35}=1$$

[c] Find the co-ordinates of the vertex/vertices.

$$(-1, 2 \pm \frac{2\sqrt{35}}{3})$$

[d] Find the eccentricity of the conic.

entricity of the conic.  

$$C^2 = \frac{140}{9} + 35 = \frac{455}{9} \rightarrow C = \frac{455}{3} = \frac{13}{2 \cdot 35} = \frac{13}{2}$$
So, THIS WILL BE A
BONUS QUESTION

If the conic is a parabola, find the equation of the directrix.
 If the conic is an ellipse, find the endpoints of its minor axis.
 If the conic is a hyperbola, find the equations of its asymptotes.

$$y-2=\pm \frac{23}{\sqrt{35}}(x+1)$$
  
 $y-2=\pm \frac{2}{3}(x+1)$ 

Consider the conic with polar equation 
$$r = \frac{15}{3 - 2\cos\theta}$$
.

[a] Is the conic a circle, a parabola, an ellipse or a hyperbola?

[b] Find the equation of the directrix.

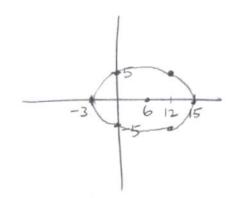

[c] Find the rectangular co-ordinates of the center of the conic.

$$\frac{\Theta}{O}$$
 |  $\frac{\Gamma}{O}$  |  $\frac{15}{2}$  |  $\frac{-3+15}{2}$  |  $\frac{15}{2}$  |  $\frac{$ 

[d] Find the rectangular co-ordinates of the endpoints of **BOTH** latera recta. **NOTE: "Latera recta" is the plural of "latus rectum".** 

FOCUS = 
$$(2 \times 6,0) = (12,0)$$
  
ENDPOINTS =  $(0,5)(0,-5)(12,5)(12,-5)$ 

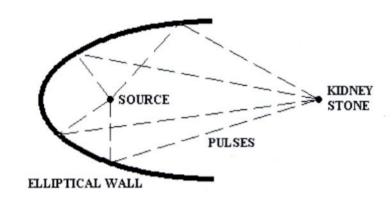

[e] Sketch the conic. You do not need to be precise, but you must label the co-ordinates on the x- and y- axes clearly.

A lithotripter is a medical device for breaking down kidney stones using acoustic pulses.

SCORE: / 15 PTS

The patient is placed so their kidney stone is at the focus of an ellipse. A source of acoustic pulses is placed at the other focus. Pulses sent from the source reflect off an elliptical wall and meet again at the other focus, where they shatter the kidney stone.

If the source and the kidney stone are 4 feet apart, and each pulse travels a total of 6 feet from the source to the wall to the kidney stone, find the standard form of the rectangular equation of the ellipse. (Assume that the origin is the midpoint of the source and the kidney stone.)

FOCAL LENGTH=4

$$C = \frac{1}{2}(4) = 2$$

MAJOR AXIS = 6

 $a = \frac{1}{2}(6) = 3$ 
 $3^2 = 2^2 + 6^2$ 
 $6^2 = 5$ 

Your quiz partner has done all preliminary analysis on the polar equation  $r = 4\sin^2\theta - 1$ . Here are the results: SCORE: \_\_\_\_\_ / 15 PTS

The symmetry tests with respect to the pole and the polar axis showed the graph is symmetric in those ways.

The range of r – values is  $-1 \le r \le 3$ .

$$4\sin^2\theta - 1 = 0$$
 when  $\theta = \frac{\pi}{6}, \frac{5\pi}{6}, \frac{7\pi}{6}, \frac{11\pi}{6}$ .

Sketch the graph. Show the polar co-ordinates of the fewest points you need to plot before using symmetry to finish the graph.
