A factory sits near two ponds, and is dumping its wastewater into both ponds. Every hour, the factory dumps	SCORE:	_ / 25 PTS
1000 liters of wastewater containing 6 grams of radioactive material per 100 liters into the east pond, and 2000	liters of wastev	vater
containing 4 grams of radioactive material per 100 liters into the west pond. In addition, the two ponds are connect	ed so that conte	nt from
each pond seeps into the other. Each hour, 400 liters of the east pond's content seeps into the west pond, and 500	liters of the wes	t pond's
content seeps into the east pond. An additional 100 liters of each pond also drains away each hour.		

If the east pond originally contained 20000 liters, the west pond originally contained 40000 liters, and both ponds were well-mixed at all times, write, **BUT DO NOT SOLVE**, a system of differential equations for the amount of radioactive material in each pond.

Commensalism is a relationship between two populations in which interaction between the two populations

SCORE: _____ / 15 PTS
helps one population (the commensal) to grow, but has no effect on the other population (the host) at all. (An example would be insects that eat
the dead skin fragments that have fallen from mammals.) The host population grows at a rate proportional to its existing population, regardless
of the presence of the commensal; whereas, the commensal population living without the host would die off at a rate proportional to its existing
population, but interactions with the host provide growth of the population. (In the discussion of the predator-prey model, we considered how
interactions affected the rate of population change.)

[a] Write, BUT DO NOT SOLVE, a system of differential equations for the populations for a commensal and a host.

NOTE: State clearly what your variables represent.

Symbolic constants that appear in your answer must represent positive numbers.

[b] Is there a non-trivial equilibrium for a commensal relationship? That is, an equilibrium other than both populations equal 0? If yes, find it. If no, justify your answer <u>algebraically</u>. (Verbal non-algebraic justifications earn no credit.)
