$$
K_{w} \mathrm{Fe}_{x}\left(\mathrm{C}_{2} \mathrm{O}_{4}\right)_{y} \cdot z \mathrm{H}_{2} \mathrm{O}
$$

Part 4 : Analysis of $F e$ (III)
The iron (III) from the green salt is going to be captured in a new, separate complex, so that the iron (IIT) can be separetly analyzed.
hydroxylamine hydrochloride

Aniline hydrogen chloride

$$
\begin{aligned}
& \mathrm{C}_{6} \mathrm{H}_{5} \mathrm{NH}_{2} \cdot \mathrm{HCl} \\
& \text { (-1) }-\ddot{w} \mathrm{H}_{2}
\end{aligned}
$$

$$
\begin{aligned}
& \text { 年年: } \\
& +\mathrm{Fe}_{\mathrm{e}}(\text { II }) \rightarrow\left[\mathrm{Fe}_{\mathrm{e}} \text { then) }\right]^{+2}
\end{aligned}
$$

ortho－phenanthroline a

absorbance complex ion
 shows that the complex $400 \mathrm{~nm} X 760 \mathrm{~nm}$ between Fe（I）and phenanthroline is most sensitive at $\lambda=510 \mathrm{~nm}$ ．This is therefore the wavelengh to use to analyze the compound，

Beer's law
extinction coefficient
absorbance] path length substance is to a particular wavelength of light.
Since the ferroin complex is well-studied, meaning $\varepsilon$ is known, and since a cuvette with a fixed pathlength (e) is used, the con cent ration of ferroin can be determined by measuring the absorbance. From this concentration, the amount of iron in the green salt can be determined.

Part 5- Hydrate analysis hygroscopic- a substance that
spontaneously absorbs water -Glassware is by groscopic,so the glassware must be heated to drive off any water be fore it is used to it does not inter fer with measunhg the hydrate

Heating to constant mass dessicator 4

If the glassware is heated appropriately, all of the water should have been driven away after the first heating, so mass measurements $\# 1$ and $\# 2$ should be the same, within a reasonable legree. If the measurements are not the same, the process is repeated until theyare, dessicant-"drying agent" - a substance that is so hygroscopic it is used to remove water from other substances, dessicator - a chamber containing dessicant used to keep glassware or reagents free of water,

To analyze the green salt, the glassware would first be heated to constant mass, then a sample of the green salt would be measured, then the salt would be heated to constant mass,

The difference in mans before and after heating the green salt is the mass of water in the green salt hydrate,
